This document outlines a procedure for rolling back the version of the LINQ program. To achieve this, a user must navigate through their computer's file system, specifically to the C: Drive, then to Program Files X86, and finally to the LINQ folder. Within this location, the user needs to manually change the current version number of the application to a previously functional one, such as altering "187" to "186". This process ensures that a stable version of the utility is restored if an update causes issues.
